SUMMARY

AI engineer building LLM-powered apps and automations with the Claude API and OpenAI API, shipped through AI-assisted development in Claude Code. Built a Python/FastAPI pipeline that turns a one-line topic into a finished short video (Claude script, OpenAI images and voice, FFmpeg render) for about $1 each, and a Cloudflare Workers + D1 platform that routes AI-drafted outreach and job applications through a human approval queue. At a US agency, built and launched its in-house email/SMS platform (6 accounts live about 5 weeks after the first commit, 3,200+ automated tests) and added Claude features to its daily content-operations app. About a year of remote work for US clients (since Sep 2025); BS Computer Science (2025). Available for full-time work; can start within 1–2 weeks.

SKILLS

- **LLMs & AI tooling:** Claude API (Haiku 4.5, Opus 5.5), OpenAI API (gpt-image image generation, gpt-4o-mini-tts voice), fal.ai, ElevenLabs; prompt design (style anchors, rule-checked scripts), human-in-the-loop approval, cost estimates before paid calls and per-provider spend tracking, AI help chat and image analysis features, AI-assisted development in Claude Code (custom skills, CLI tools that Claude operates)
- **Automation & integrations:** REST APIs, webhooks, JSON, cron jobs, queues and idempotent retries, Google Apps Script, Gmail API, Google Sheets API, GoHighLevel API, Resend, Twilio, Stripe, Square API; familiar with n8n (one 47-node workflow design, personal project)
- **Web & backend:** Python (FastAPI), JavaScript, TypeScript, Hono, React, Vite, Tailwind CSS; Cloudflare Workers, D1, Queues, Cron Triggers, R2, Pages, Email Routing, Tunnel; Firebase; Vercel; FFmpeg; Vitest; GitHub Actions; Git/GitHub
- **CRM & email (supporting experience):** GoHighLevel, HubSpot, Kajabi, Mailchimp, ActiveCampaign, SPF/DKIM/DMARC, A2P 10DLC
- **Languages & setup:** English (professional working proficiency), Filipino (native) · laptop, two separate internet providers (one as backup), UPS for the internet router

AI PROJECTS

Personal projects, built with AI-assisted development (Claude Code); walkthroughs on request.

yt-engine: AI short-video pipeline

Python · FastAPI · Claude API · OpenAI API (images, text-to-speech) · FFmpeg · Cloudflare Tunnel

- Turns a one-line topic into a finished 1080x1920 MP4 with covers and ready-to-paste TikTok, Shorts and Reels captions: Claude writes the script, OpenAI makes the images and voiceover, and a custom FFmpeg engine renders motion, crossfades, burned captions and ducked music. Never auto-uploads; every post is approved and posted by hand.
- Held cost to about $1 per video (vs about $12 for paid generative video; a real 2-part series cost $0.72) by rendering Ken Burns motion on AI-generated stills; shows a cost estimate before any paid call and tracks spend per provider.
- Built a CLI and a Claude Code skill so Claude runs the service from chat (estimate, make, status, retry), with paid commands blocked until an explicit yes. Prompting adds a per-video style anchor to every image prompt, checks scripts against hook rules, and suggests topics from real YouTube search suggestions.
- Restart-safe job queue with retries that never pay twice for an asset; switchable image and voice providers; covered by 406 unit tests and 300 acceptance checks against a fake paid-API stand-in.

Pipeline: outreach and job-application platform

JavaScript · Hono · Cloudflare Workers, D1, Cron Triggers, Email Routing · Google Apps Script · Gmail API

- Built a single-user CRM and email platform: contacts, a 7-stage pipeline board, 1–5 step campaigns that stop on a reply, unsubscribe or bounce, hosted forms, threaded conversations and an approval queue for one-to-one emails.
- Jobs module: loads Claude-researched job posts and Claude-drafted applications, each with a fit score and verdict, into an approve / hold / skip queue with reply and interview rates. Auto-send is allowed only for strong fits with no open questions, enforced by a database CHECK constraint and re-checked before sending.

- Gmail bridge: a Google Apps Script sends approved applications from Gmail through secret-authenticated endpoints and reports the first real reply back (auto-replies and bounces skipped); a companion Gmail API tracker separates employer replies from job alerts and flags look-alike scam emails.
- Real sending off by default (outbox), HMAC-signed links, address-level suppression list and idempotent retries; 546 automated tests that run with no network.

EXPERIENCE

Implementation Specialist — CRM, Web & Marketing Systems

Arrow Group Consulting · Michigan, USA (remote) · Part-time contract · Feb 2026 – Present

Handles 8 clients at once at a US outsourced-CMO agency (hired directly after the Doneverse placement): technical lead for client onboarding and builder of its in-house platform.

In-house email/SMS marketing platform — TypeScript, Cloudflare Workers + Hono, D1, Queues, Resend, Twilio, React/Vite

- Built and launched the platform (contacts, newsletters, SMS campaigns, reply inbox) with AI-assisted development in Claude Code; 6 accounts went live about 5 weeks after the first commit (Aug–Sep 2026). The agency is now replacing GoHighLevel with it.
- Added Claude API drafting helpers for subject lines and preview text, plus OpenAI gpt-image-1 image generation.
- Wrote the business case (projected ~89% lower monthly platform cost, no external build spend) and planned a phased migration of 10,000+ client contacts, running the old platform in parallel.
- Designed send-safety and access controls: test mode by default (server-side recipient allowlist), opt-outs re-checked before every send, SMS blocked until A2P 10DLC approval, a fail-closed API and 4-role default-deny authorization.
- Tested inside workerd (the Workers runtime) against isolated D1 databases and fake provider credentials, so no test can send a real message.

AGC HUB — internal content-operations app (React, Firebase, Vercel serverless, GoHighLevel API)

- Added Claude Haiku 4.5 features through serverless API routes: subject-line generation, revision suggestions, a help chat and task-image analysis.
- Brought the content team's work from 5 tools (Drive, ClickUp, Trello, GoHighLevel, Canva) into one app that runs its daily workflow.

Client systems and onboarding

- Built client back-office tools on Cloudflare Workers: a nonprofit funnel-tracker dashboard and a resale startup's admin dashboard (D1, GoHighLevel signup webhook, payout emails, hourly pipeline reconcile).
- Integrated Square payments through the Square API on a Cloudflare-hosted client site. Moved client websites to Cloudflare and build new client sites there (since Feb 2026); also migrated a WordPress client's site to Wix.
- Run client onboarding end to end (GoHighLevel sub-accounts, Cloudflare Pages sites, DNS, SPF/DKIM/DMARC sending domains, A2P 10DLC registration) and explain each build in plain language on onboarding calls; warmed a radio station's sending subdomain to 6,500 emails/day.

Virtual Marketing Assistant (VMA), agency placement

Doneverse · Philippines · Sep 2025 – Feb 2026

Agency that recruits, trains and matches marketing talent with US founders.

- Technical implementer for 2 US founders: Arrow Group Consulting's founder (Sep 2025 – Jan 2026; led to a direct hire), then keynote speaker Jonathan Fanning (Kajabi); built Wix Studio, Kajabi, Mailchimp and HubSpot accounts.
- At Arrow Group Consulting, learned HubSpot on the job, then recommended HubSpot and ActiveCampaign; the agency adopted both, and ActiveCampaign fixed one client's Mailchimp login errors.

EDUCATION

BS Computer Science, Gordon College, Olongapo City · 2021–2025

Thesis published at IRCITE 2025 (Bulacan State University).

Senior High School, TVL–ICT Track, Columban College Inc., Olongapo City · 2019–2021 · Graduated With High Honors
